### Management of metastatic colorectal cancer

Simultaneous bowel and metastases

Hepatectomy after primary

Primary after hepatectomy

Chemotherapy prior to either resection

![](_page_17_Picture_5.jpeg)

### Management of metastatic colorectal cancer

- Simultaneous bowel and metastases
- Hepatectomy after CRCa primary
- CRCa primary after hepatectomy

![](_page_18_Picture_4.jpeg)

Chemotherapy prior to either resection

Order does not appear to be important – need to ensure patient receives both surgery and chemotherapy

### **Chemotherapy - Important questions**

- Is adjuvant chemotherapy beneficial?
- Is preoperative (downsizing) chemotherapy beneficial in
  - Unresectable ?
  - Bordeline resectable ?
  - Unfit ?
- Is preoperative (neoadjuvant) chemotherapy justified for resectable lesions ?

### **Chemotherapy - Important questions**

- Is adjuvant chemotherapy beneficial ?
  PROBABLY
- Is preoperative (downsizing) chemotherapy beneficial in
  - Unresectable ? YES
  - Bordeline resectable ? YES
  - Unfit ?
- Is preoperative (neoadjuvant) chemotherapy justified for resectable lesions ?

YFS

### Perioperative chemotherapy with FOLFOX4 and surgery versus surgery alone for resectable liver metastases from colorectal cancer (EORTC Intergroup trial 40983): a randomised controlled trial

Bernard Nordlinger, Halfdan Sorbye, Bengt Glimelius, Graeme J Poston, Peter M Schlag, Philippe Rougier, Wolf O Bechstein, John N Primrose, Euan T Walpole, Meg Finch-Jones, Daniel Jaeck, Darius Mirza, Rowan W Parks, Laurence Collette, Michel Praet, Ullrich Bethe, Eric Van Cutsem, Werner Scheithauer, Thomas Gruenberger for the EORTC Gastro-Intestinal Tract Cancer Group, \* Cancer Research UK, \* Arbeitsgruppe Lebermetastasen und-tumoren in der Chirurgischen Arbeitsgemeinschaft Onkologie (ALM-CAO), \* Australasian Gastro-Intestinal Trials Group (AGITG), \* and Fédération Francophone de Cancérologie Digestive (FFCD) \*

- 35% vs 24% disease free survival at three years for FOLFOX group
- No overall survival advantage
- More surgery related complications in the FOLFOX group (25% vs 16%)

#### Perioperative FOLFOX4 chemotherapy and surgery versus surgery alone for resectable liver metastases from colorectal cancer (EORTC 40983): long-term results of a randomised, controlled, phase 3 trial

Bernard Nordlinger, Halfdan Sorbye, Bengt Glimelius, Graeme J Poston, Peter M Schlag, Philippe Rougier, Wolf O Bechstein, John N Primrose, Euan T Walpole, Meg Finch-Jones, Daniel Jaeck, Darius Mirza, Rowan W Parks, Murielle Mauer, Erik Tanis, Eric Van Cutsem, Werner Scheithauer, Thomas Gruenberger, for the EORTC Gastro-Intestinal Tract Cancer Group, Cancer Research UK, Arbeitsgruppe Lebermetastasen und-tumoren in der Chirurgischen Arbeitsgemeinschaft Onkologie (ALM-CAO), Australasian Gastro-Intestinal Trials Group (AGITG), and Fédération Francophone de Cancérologie Digestive (FFCD)

![](_page_23_Figure_6.jpeg)

# Other issues with chemotherapy:

 Trial of time versus progression on chemotherapy

• Disappearing lesions

• Liver damage post chemotherapy

• Delay to surgery after chemotherapy

![](_page_24_Picture_5.jpeg)

![](_page_24_Picture_6.jpeg)

#### Response on chemo an important predictor

![](_page_25_Figure_1.jpeg)

![](_page_25_Figure_2.jpeg)

- Studies including selected patients (liver metastases only, no extrahepatic disease) (r=0.96; p=0.002)
- ▲ Studies including nonselected patients with mCRC (solid line) (r=0.74; p<0.001)</p>
- Phase III studies including nonselected patients with mCRC (dashed line) (r=0.67; p=0.024)

#### Complete response of CRCa liver metastases

# Liver directed therapies

![](_page_36_Picture_1.jpeg)

#### Irinotecan loaded Microspheres (DEBIRI)

- Catheter minimally invasive therapy
- Polyvinyl alcohol microspheres
- Ischaemia and drug delivery
- Single treatment event
- No systemic effects

![](_page_37_Picture_6.jpeg)

![](_page_37_Picture_7.jpeg)

# Response

Response	3-months	6-months	12-months
Complete	8	9	12
Partial	35	22	22
Stable	19	30	36
Progression	3	13	18

Compared to best supportive care, RR 2-5% at 3-6 months

### Radio-embolisation (SIRT)

- Yttrium-90 is a beta emitter with t1/2 64 hours
- Maximum range of penetration 11mm (mean 2.5m)
- Normal liver poor tolerance to DXR
- Blood supply of liver tumors almost entirely arterial
- Able to administer selectively by a minimally invasive technique

![](_page_39_Picture_6.jpeg)

![](_page_39_Picture_7.jpeg)

### Salvage therapy of treatment refractory disease

### Chemo-refractory liver dominant disease

![](_page_41_Figure_1.jpeg)

Appears to be a clear benefit in survival for unresectable, heavily pre-treated CRCa liver metastases

### Local ablative therapies

- Percutaneous ethanol injection (PEI)
- Cryotherapy
- Microwave coagulation therapy (MCT)
- Laser induced thermotherapy (LITT)
- Radiofrequency ablation (RFA)
- Microwave ablation (MWA)
- Nano-knife

![](_page_42_Picture_8.jpeg)

![](_page_42_Picture_9.jpeg)

#### Radiofrequency ablation of CRCa liver metastases

- Systematic review<sup>1</sup> 2 comparative studies, 11 case series
- Post procedure complication rate 0-33%
- Shorter survival than surgical resection
- Local recurrence rate 4-55%

	RFA	Resection		
Survival (months)	44 (median)	54 (mean)		
5-year survival (%)	40	53		

For lesions <3 cm, RFA and resection probably equivalent<sup>2</sup>

<sup>1</sup>Sutherland et al., Arch Surg 2006; 141:181-90 <sup>2</sup>Mulier S et al., Dig Surg 2009; 25(6):445

#### Microwave ablation of liver tumours

- MWA zones larger than for RFA
- Rapid heating
- Local vessels cause less deflection
- No pathological difference in degree of necrosis
- (Lower recurrence rates)

![](_page_44_Picture_6.jpeg)

### Summary: An evolving paradigm

#### The Past 2000

Not resectable (80-90%)

#### The Present 2013

![](_page_45_Figure_4.jpeg)

Adam R. ASCO 2007, Abdalla et al Ann Surg Oncol 2006; 13(10

# **Overall summary**

- Too few patients with potentially curable disease referred
- Definition of resectability has changed
- Chemotherapy does improve long-term outcome (perioperative or adjuvant)
- Risks of prolonged systemic therapy must be weighed against benefits
- Liver targeted therapies (DEBIRI, SIRT) appear to offer survival benefit, but need to better define treatment group
- Minimally invasive tissue ablation complements resection
- Individualized, multidisciplinary approach required to optimize outcomes

![](_page_47_Picture_0.jpeg)
