## Groans and Bones - Concurrent Workshop Repeated

Friday, 21 June 2013

Start 11:00am

Start 12:05pm

Duration: 55mins

Duration: 55mins

Sigma

Sigma

  **Rotorua GP CME 2013**

General Practice Conference & Medical Exhibition

**20-23 June 2013 | Energy Events Centre | Rotorua**

# Groans and Bones

John Petrie

NZMA GP Conference 2013

ROTORUA

# Disclaimer: Commercial support from...

- Lilly
- MSD
- Novartis
- Roche
- Pfizer
- Sanofi
- Wyeth
- Abbvie

# Key Points

- Rheumatoid Arthritis
  - Importance of early referral of synovitis
  - Aggressive intervention with disease-modifying drugs
- Gout
  - Pain relief and Urate Lowering Therapy are the two distinct arms of Gout treatment
  - Treat to the target of 0.30
- Osteoporosis
  - The purpose of diagnosis is to prevent fragility fracture
  - Risk assessment tools perform better than screening with DEXA scanning

# Pierre Auguste Renoir 1841-1919

# A Paradigm Shift in the approach to Rheumatoid Arthritis

- Now:
  - Treat to Target
  - Remission induction
  - Damage prevention
  - Maintain function and productivity
- Then:
  - Symptom control
  - Moderation of disease progression
  - Accommodation of disability

# What is RA?

# RA: A Construct

- “A chronic, autoimmune inflammatory disease, characterised by joint swelling, joint tenderness and synovial joint destruction, leading to severe disability and premature mortality”

# Features of the 1987 Criteria

- Developed to differentiate RA from other recognised arthritides
- Utilised characteristics of established disease
- Used in epidemiology and therapeutic research trials
- Relevant at a time when treatment goals were limited to diminishing disability

## Table 3 – ACR criteria for the diagnosis of RA

---

At least 4 of the following 7 criteria must be met (criteria 1 through 4 must have been present for at least 6 weeks):

- Morning stiffness for at least 1 hour.
- At least 3 joint areas simultaneously had soft tissue swelling or fluid (not bony overgrowth alone) observed by a physician; the 14 possible areas are right or left PIP joint, MCP joint, wrist, elbow, knee, ankle, or MTP joint.
- At least 1 area swollen (as defined above) in a wrist, MCP joint, or PIP joint.
- Simultaneous involvement of the same joint areas on both sides of the body (bilateral involvement of PIP, MCP, or MTP joints is acceptable without absolute symmetry).
- Subcutaneous nodules over bony prominences or extensor surfaces or in juxta-articular regions, observed by a physician.
- Demonstration of abnormal amounts of serum RF by any method for which the result has been positive in < 5% of normal control subjects.
- Radiographic changes typical of RA on posteroanterior hand and wrist radiographs, which must include erosions or unequivocal bony decalcification localized in or most marked adjacent to the involved joints (OA changes alone do not qualify).

---

ACR, American College of Rheumatology; RA, rheumatoid arthritis; PIP, proximal interphalangeal; MCP, metacarpophalangeal; MTP, metatarsophalangeal; RF, rheumatoid factor; OA, osteoarthritis.

# Late Features of RA

Nodules

Erosions

# Late Stages of RA

Medscape®

[www.medscape.com](http://www.medscape.com)

Source: ACP Medicine © 2004 WebMD Inc.

# Impetus for Change

- Value of optimising DMARD use (MTX, GC)
- Benefits of early intervention; improving clinical outcomes and reducing disability
- Availability of new “biological” agents
- Development of a new prognostic indicator (Anti Citrullinated Peptide Antibodies, ACPA or Anti-CCP)

# 2010 ACR/EULAR RA Classification Criteria

- Target population (who should be tested?): patients who
  - 1) have at least one joint with definite clinical synovitis (swelling)
  - 2) with the synovitis not better explained by another disease
- A score-based algorithm: add score of categories A–D; a score of  $\geq 6/10$  is needed for classification of a patient as having definite RA

# Primary Entry Criterion: Swollen Joint

# Not DIP, 1<sup>st</sup> CMC or 1<sup>st</sup> MTP

Characteristic distribution of  
Osteoarthritis

# Categories A - D

- A: JOINT INVOLVEMENT

Large, small, 1-10 or more

Score 0-5

- B: SEROLOGY

RhF, Anti-citrullinated peptide Ab

Score 0-3

- C: ACUTE PHASE PROTEINS

CRP/ESR normal/abnormal

Score 0-1

- D: DURATION OF SYMPTOMS

< 6 weeks,  $\geq 6$  weeks

Score 0-1

# A: Joint Involvement

- 1 large joint 0
- 2–10 large joints 1
- 1–3 small joints (with or without involvement of large joints) 2
- 4–10 small joints (with or without involvement of large joints) 3
- >10 joints (at least one small joint) 5

## B: Serology

- Negative RF *and* negative ACPA 0
- Low-positive RF *or* low-positive ACPA 2
- High-positive RF *or* high-positive ACPA 3

# C: Acute Phase Proteins

- Normal CRP *and* normal ESR 0
- Abnormal CRP *or* abnormal ESR 1

## D: Duration of Symptoms

- <6 weeks 0
- ≥6 weeks 1

# Significant Differences

- A requirement for the presence of a swollen joint, and the exclusion of alternative explanations
- Absence of requirement for symmetry
- Less emphasis on Rheumatoid Factor
- Absence of the features of longstanding disease
- No mention of morning stiffness

# Recommended Initial Management of RA (or even *suspected* RA)

- Combination of Methotrexate and Low Dose Glucocorticoids (Prednisone) as soon as the diagnosis is made
- Target remission or low disease activity
- Use Leflunomide, sulfasalazine or gold injections if Methotrexate contraindicated
- Initiate a TNF inhibitor if DMARD/GC ineffective
- Change to another “Biological” if TNF inhibitor ineffective

EULAR recommendations for the treatment of RA  
Ann.Rheum.Dis. 2010;69 (June):964-975

First-line Disease Modifying Anti-Rheumatic Drug

**METHOTREXATE**

# Methotrexate Administration

- Rapid escalation of dose 10 → 15 → 20mg at 2-4 weekly intervals
- Fortnightly monitoring of FBC & LFTs
- Folic Acid supplementation
- *Benefit expected in at least 80% of DMARD naïve patients*

# Methotrexate Toxicity

- Gastrointestinal (nausea, vomiting, diarrhoea) 30%
- Hepatic (aminotransaminase elevation above ULN) 18·5%
- Skin/Hair (rash, alopecia, pruritis) 8·9%
- CNS (headache, depression, lethargy, malaise) 5·5%
- Cytopaenia 5·5%
- Lung (cough) 2·4% (pneumonitis 0·43%)
- **DISCONTINUATION 2° TO AEs 10%**

Not without controversy in the past...

# **GLUCOCORTICOIDS**

# Myths of Glucocorticoid Rx

- Useful only for anti-inflammatory action
- Use only as short term pain relief
- Side effects outweigh benefits
- “Wean” patients off ASAP
- A morning dose mimics the circadian rhythm and is physiologically appropriate

# A Negative View of Glucocorticoids

- No dose-ranging studies
- Enthusiastic administration by treating physicians
- Indiscriminate use
- Absence of protocols or guidelines

# Low Dose Prednisone in RA

- Proven, valued effect in early symptomatic relief
- Substantive evidence of disease-modifying effect
- Favourable treatment continuation profile
- Only other intervention with such rapid disease suppression is with “Biologicals”
- Night-time dose physiologically beneficial

# TNF Blockers

- Enbrel (etanercept)
- Remicade (infliximab)
- Humira (adalimumab)
- \$25,000 per year
- Effective in approximately 50% of non-DMARD responsive sufferers

# Not yet approved for use in for RA NZ

- Abatacept. An antibody to a surface marker “CD-80” on T cells, a necessary costimulator for T cell activation
- Rituximab. An anti-B cell monoclonal antibody used in Lymphomas with good effect in RA patients
- Tocilizumab. An antibody to another cytokine, IL 6

# New ARA/EULAR Diagnostic Criteria: Given at least 1 swollen, inexplicable joint:

- ***Joint involvement*** by size and number (0-5)
- ***Serology*** i.e. RhF & anti-CCP absent, low titre or high titre (0-3)
- ***Duration*** 0 <6 weeks> 1
- ***Acute Phase Reactants*** ESR/CRP absent 0, present 1
- ***Definite RA*** can be diagnosed with a total score of 6 or more

# Treatment Options for RA

- Early introduction of Methotrexate and Oral Glucocorticoids
- Escalation to alternative Disease Modifying Anti-Rheumatoid Drugs (DMARDs)
- Consideration of “biologicals”; TNF inhibitors and alternatives
- EARLY REFERRAL TO RHEUMATOLOGISTS
- And we can stop this...

**Let me make this Crystal, Clear**

The Treatment of Gout

The GOUT.

# Urate load in asymptomatic patients

# The Two Independent Arms of Gout Management

**ACUTE PAIN, AND THE  
RELIEF OF SUFFERING**

**URATE LOWERING  
THERAPY, PROPHYLAXIS**

Both Patients and Health Professionals confuse the two

# Management of Gout

## Acute treatment of Pain

- NSAID or Coxib  
(Diclofenac, Naproxen, Etoricoxib)
- Colchicine
- Prednisone
- Intra-articular steroid
- ACTH
- Anakinra, Canakinamab

## Prevention by reducing Urate load

- Allopurinol
- Probenecid
- Febuxostat
- Benzbromarone
- Pegloticase
- “RDEA594”

# Obstructions to long-term management of Gout

- Confusing the two goals; pain relief and prophylaxis
- Poor communication
- Argument amongst providers
- Misunderstanding the duration and objectives of treatment

# Patient issues

- Lack of understanding
- Non-compliance, non-adherence, non-concordance
- Bad experiences with prior therapy
- “Know your number”

# Provider issues

- Failure to understand or inform
- Undo bad habits
- Treat to Target
- Monitor SUA
- Get ***over*** the 300mg allopurinol hurdle

# Urate Lowering Therapy

- Allopurinol
- Probenecid
- Febuxostat
- Benzbromarone
- Pegloticase

# Urate lowering Targets

# Establishing Allopurinol Therapy

- Lifelong therapy, chronic disease model
- Dose escalation on initiation - monthly
- Cover first 6 months with NSAID or colchicine or glucocorticoid
- Do not stop allopurinol for acute attacks

# How Low Should You Go?

0.30 mmol/L

# AHS

- The true incidence of AHS is unknown, estimated to be ~0.1%.
- Many cases of AHS have occurred in patients treated for asymptomatic hyperuricaemia
- Mortality associated with AHS as high as 27%
- No cure for AHS, early recognition and drug withdrawal are important
- Management - supportive care

# Relationship between starting dose and AHS

# Starting Dose for Allopurinol in patients with renal compromise

- 1.5mg/ml eGFR
- Increase at monthly intervals to target
- Assess compliance if target not achieved

# Benzbromarone

- Inhibitor of URAT-1
- Effective even in renal failure
- Withdrawn because of hepatic toxicity
- Metabolised by CYP2C9, poor metaboliser alleles of which may help predict susceptible patients
- May soon be available in NZ

# Take Home Messages

- Importance of differentiating treatment goals
- “Know your Number”
- Potential new therapies

# **If It Ain't Broke, Then FRAX It**

- A bare bones approach to Osteoporosis

# Take-home message:

- Osteoporosis in post-menopausal women:
  - Those with a T score  $\leq -2.5$  are at most risk of fracture
  - A T score of  $\leq -2.5$  is NOT sufficient to initiate drug treatment
  - 82% of women who fracture will have a T score  $> -2.5$
- Management should be directed by absolute fracture risk rather than T score alone

# What is Osteoporosis?

- “A chronic, progressive disease of multifactorial aetiology”
- “A systemic skeletal disease”
- “Brittle Bone Disease”
- An age-related decrease in mineralised osteoid, exacerbated by reduced gonadal function, predisposing to fragility fracture.

# Osteoporotic bone loss

- Bone density is measured in grams of mineral per area or volume
- Bone quality is a function of
  - Architecture
  - Turnover rate
  - Mineralisation

# Extent of bone loss with age

- Age confers a 7 times greater risk of fracture for any given T score
- Women lose 30-40% of cortical, 50% of cancellous bone over their lifespan
- Men lose 15-20% cortical, 25-30% cancellous bone over theirs

# Involutional Osteoporosis

# Operational definition of Osteoporosis

- A T score of  $\leq -2.5$
- WHO 1994
- Initially defined for the purposes of epidemiology, this figure now masquerades as
  - A diagnostic test
  - A funding criterion
  - A treatment decision

# What is a T score?

- A comparison to young normals, ie peak bone mass
- “Normal” T score is between -1 and +1, where 68% of the 30yr old population lie

# World Health Organization (WHO) Osteoporosis Guidelines

**\*\* Severe Osteoporosis = -2.5 + Fracture**

World Health Organization. *Guidelines for Preclinical Evaluation and Clinical Trials in Osteoporosis*, 1998.

# WHO Criteria for Postmenopausal Osteoporosis

The T-score compares an individual's BMD with the mean value for young normal individuals and expresses the difference as a standard deviation score.

| Category                   | T-score               |
|----------------------------|-----------------------|
| Normal                     | -1.0 and above        |
| Low bone mass (osteopenia) | Between -1.0 and -2.5 |
| Osteoporosis               | Below -2.5            |

# Data From NORA

## National Osteoporosis Risk Assessment

# Data From NORA

## National Osteoporosis Risk Assessment

# Data From NORA

## National Osteoporosis Risk Assessment

# Important Risk Factors for Fracture

- Age (major contributor to fracture risk)
- Sex (women > men)
- Low BMD
- Race
- Family history
- Previous fracture
- BMI (weight and height)
- Smoking

# NICE Guidelines for fracture risk assessment

- All women > 65, all men > 75
- In younger women and men in the presence of clinical risk factors
- Do not assess in people < 50 in the absence of major risk factors
- Do not routinely measure risk without prior assessment with FRAX
- Consider DEXA when FRAX result is near an intervention threshold

# NOF Treatment Criteria

- Using FRAX assessment tool:
  - A 10 year probability of any major fracture of 20%
  - A 10 year probability of hip fracture of 3%

## Calculation Tool

Please answer the questions below to calculate the ten year probability of fracture with BMD.

Country: **New Zealand**

About the risk factors 

## Questionnaire:

1. Age (between 40-90 years) or Date of birth

Age:  Date of birth: Y:  M:  D:

2. Sex

☐ Male ☒ Female

3. Weight (kg)

4. Height (cm)

5. Previous fracture

☒ No ☐ Yes

6. Parent fractured hip

☒ No ☐ Yes

7. Current smoking

☒ No ☐ Yes

8. Glucocorticoids

☐ No ☒ Yes

9. Rheumatoid arthritis

☐ No ☒ Yes

10. Secondary osteoporosis

☒ No ☐ Yes

11. Alcohol 3 or more units per day

☒ No ☐ Yes

12. Femoral neck BMD (g/cm<sup>2</sup>)

Select DXA

|--------------------|-----------|
| Major osteoporotic | <b>23</b> |
| Hip fracture       | <b>12</b> |

# NOF Treatment Criteria

- Using FRAX assessment tool:
  - A 10 year probability of any major fracture of 20%
  - A 10 year probability of hip fracture of 3%

# What can we expect from Bisphosphonates?

- Prospective, randomised and double-blind studies over 3-5 year periods suggest a total fracture relative risk reduction of 35-40%
- “Real world” analyses support a benefit of 22% *RRR* in compliant patients

# Take-home message:

- Osteoporosis in post-menopausal women:
  - Those with a T score  $\leq -2.5$  are at most risk of fracture
  - A T score of  $\leq -2.5$  is NOT sufficient to initiate drug treatment
  - 82% of women who fracture will have a T score  $> -2.5$
- Management should be directed by absolute fracture risk rather than T score alone

# Key Points

- Rheumatoid Arthritis
  - Importance of early referral of synovitis
  - Aggressive intervention with disease-modifying drugs
- Gout
  - Pain relief and Urate Lowering Therapy are the two distinct arms of Gout treatment
  - Treat to the target of 0.30
- Osteoporosis
  - The purpose of diagnosis is to prevent fragility fracture
  - Risk assessment tools perform better than screening with DEXA scanning

QE HEALTH

*enhancing mind  
body & spirit*

45 yr ♀, T score -2.5,  
10 year # risk 2.3%

No treatment

Bisphosphonate

75 yr ♀, T score -2.5,  
10 year # risk 23%

No treatment

Bisphosphonate

# What do patients think?

- Justifiable risk for drug treatment:
  - Hip fracture
    - ◆ Patients 50% (25-60)
    - ◆ Doctors 10% (5-20);  $p < 0.0001$
  - Major osteoporotic fracture
    - ◆ Patients 50% (25-60)
    - ◆ Doctors 10% (10-20);  $p < 0.0001$
- Required reduction in Relative Risk
  - 50%

# Patient expectation

50% risk of Fracture

50% risk reduction
